

Class Exercise

Week 12

Class Exercise

- Create a program that will store a list of contacts
 - There are three types of contacts
 - A person with a name and phone number
 - A student with a name, a phone number, and the school they attend
 - An employee with a name, a phone number, and the place they work

A student is a person and an employee is also a person.
 - The program will ask what type of contact to enter, and will continually ask until the user says they are done. Then it will display all the contacts entered.
 - If the contact is a person – it will display their name and phone number
 - If the contact is a student – it will display their name and phone number and then the school they attend
 - If the contact is an employee – it will display their work place followed by their name and phone number
